

JAMES AKPAN.

FRONTEND DEVELOPER

/ ALL ABOUT ME

I am a front-end Developer with eyes for great designs. Over the past 2 years I have gone from being a novice at HTML to create web applications and websites with web technologies like HTML, SCSS and REACT.

/ WORK EXPERIENCE

>> Junior Web Developer

TeamFM | 2019-2020 (November-January)

I was tasked with creating UI components with React that displayed relevant data to users. On this project I was exposed to React and Redux and it allowed me to build a great foundation.

>> Contract Web Developer

Yeticloud | 2020 (March).

I helped to build the official website for YetiCloud using WordPress. I wrote CSS and JS into the WordPress theme occasionally to create a specific custom layouts and features. Working on this project helped me grow my CSS and WordPress skills.

>> Freelance Web Developer

Current Position since April 2020

For the past 4 months, I have been working independently and I have to build a number of websites and web applications using WordPress, HTML/CSS/JS or react, depending on what the client is looking to achieve.

/ TOP 3 PROJECTS

>> React Todo (With User authentication)

REACT, SCSS

I built a todo app with user authentication. My favourite part of the project was making it unique for each user- for this I had to use Firebase to store users' data and also authenticate each one.

- demo: <https://todojames.netlify.app/>

>> Personal Website

HTML, SCSS, JS

I created a website/portfolio for myself which I could showcase to potential clients and employers. I enjoyed making this layout mainly because I designed it myself from scratch. It was interesting to see something that was once an imagination come to life. I also made sure it was responsive for all devices.

>> ISS POSITION (Connect to an API)

HTML, SCSS, JS

This one is one of my favourite projects because it introduced me to how APIs work. I was able to fetch the current position of the International Space Station, take out the Longitude and Latitude and then use this data to place the ISS image on the earth's map. It shows (almost) accurately where the ISS is on the earth's orbit. Working with mapbox's api too was interesting!
